

PayAnalytics — Reviewer Style Guide

For language reviewers proofreading AI translations in Lokalise.

1. About PayAnalytics

PayAnalytics is a B2B SaaS platform used by HR teams, compensation managers, and DEI leaders to **analyse pay equity** and support **pay transparency** compliance. The application produces statistical analyses (regression-based pay gap analysis, equal-pay-for-equal-value comparisons, workforce analytics) and reporting outputs aligned with local regulations (e.g. the EU Pay Transparency Directive, Iceland's Equal Pay Standard, US state salary-range disclosure laws).

Users are professionals, not consumers. They expect precise, formal language that reflects an analytical and legally-aware tool.

Note for reviewers: for information about the latest product messaging and updates, refer to payanalytics.com.

2. Business context every reviewer should know

Pay equity

The principle that employees should receive **equal pay for equal work, or work of equal value**, regardless of gender, race, ethnicity, age, or other protected characteristics. Analyses typically look at compensation data with statistical controls (tenure, role level, performance, location, etc.) to separate the **unadjusted pay gap** (raw average difference) from the **adjusted pay gap** (the portion that remains after explaining away legitimate compensable factors).

Pay transparency

A practice — and increasingly a legal obligation — where employers disclose pay ranges, gender pay-gap data, or actual pay levels. Drivers include the **EU Pay Transparency Directive (Directive (EU) 2023/970)**, the **Icelandic Equal Pay Standard (ÍST 85)**, and US state laws (e.g. California, Colorado, New York, Washington). PayAnalytics helps customers comply with reporting obligations and communicate findings internally and externally.

Common terms reviewers will see

English	What it means
Pay gap (adjusted / unadjusted)	Difference in average pay between groups, before/after statistical controls
Equal pay for work of equal value	Comparing different jobs deemed of equivalent value (job evaluation)
Compensation band / pay band / salary band	A defined min–max pay range for a role or grade
Job evaluation	Methodology to score jobs by responsibility, skill, effort, conditions
Comparator group / reference group	Population used as the baseline in a comparison
Regression analysis	Statistical model isolating the effect of one variable while controlling for others
Statistical significance / p-value	Probability the observed difference is due to chance
Workforce analytics	Broader people-data analysis (representation, attrition, hiring)
Total compensation	Base salary + variable pay + benefits

These are **terms of art**. Translate them with the legally/technically recognised equivalent in the target language — not a colloquial paraphrase.

3. Voice & register

- **Audience:** HR analysts, compensation managers, DEI leads. Professional, comfortable with statistics and labour law.
- **Voice:** professional yet approachable. Clear, concise, confident but humble.
- **Register:** formal throughout. Always use the formal second-person form (*vous* / *Sie* / *usted* / *Lei* / *u* / *siz* / *Anda* / *você* / *Pan/Pani* etc. depending on language). **Never** the casual form.
- **Tone:** factual and precise. The product reports on legally sensitive data — avoid hedging language that could read as evasive.
- **Sentence length:** short. Aim for ≤15 words where possible.
- **Active voice** preferred over passive, where target-language norms allow.
- **Gender-neutral phrasing** where the source supports it (e.g. avoid defaulting to masculine when a neutral form exists in the target language).

Don't

- Use regional colloquialisms.
- Use exclamation marks except where the source uses one and tone genuinely warrants it.

- Use all-caps for emphasis (acronyms excepted).
 - Use contractions in formal-register languages.
 - Translate brand or product names. Keep "PayAnalytics" verbatim.
 - Translate ICU placeholders, HTML tags, or variables (`{name}` , `{{count}}` , `%s` , `<strong>` , `<em>`). Re-order them only as the target grammar requires.
 - Translate technical identifiers (column names, file paths, code snippets) unless the source itself provides a localised label.
-

4. Terminology & consistency

- **Brand & product names** stay verbatim: `PayAnalytics` , feature names, module names.
 - **Technical/statistical terms** translate to the target-language **term of art**, not a paraphrase.
Examples:
 - "regression analysis" → French: *analyse de régression*; German: *Regressionsanalyse*; Spanish: *análisis de regresión*.
 - "pay gap" → French: *écart salarial*; German: *Lohnlücke / Entgeltlücke*; Spanish: *brecha salarial*.
 - "compensation band" → French: *fourchette de rémunération*; German: *Vergütungsband*; Spanish: *banda salarial*.
 - **Abbreviations** (HRBP, DEI, FTE, etc.) — keep the English abbreviation if the target audience uses it that way; translate only when there's a well-established local equivalent.
 - **Glossary** in Lokalise is authoritative. If the source matches a glossary entry, use the glossary translation. If you disagree, flag it for the project owner — don't unilaterally diverge.
 - **Translation memory (TM)** entries are prior approved translations. Match TM exactly when a source string is repeated, even across screens.
-

5. Formatting & technical content

- **ICU placeholders:** `{name}` , `{firstName}` , `{count, plural, ...}` — keep names exactly. Position can move to fit grammar.
- **HTML tags:** `<strong>` , `<em>` , `<a href="...">` . Keep tags and attributes intact. Move the wrapped text as needed.
- **Variables:** `%s` , `%d` , `{{var}}` , `${var}` — never translate or modify.
- **Character limits:** if a `max_char_limit` is shown in Lokalise, stay within it. If you can't, flag for review rather than truncate awkwardly.
- **Numbers / dates / currencies:** use the target locale's conventions (separators, ordering). Don't convert currency values themselves.
- **Punctuation:** follow target-language rules (French non-breaking spaces, Spanish inverted marks, Japanese full-width).

- **Capitalisation:** follow target-language rules, not English title-case habits. Most languages use sentence case for headings.
-

6. What to fix vs. flag

Fix and approve when the AI translation has:

- Minor wording adjustments for naturalness
- Locale-correct punctuation/spacing
- Terminology aligned with the glossary
- Improved formal register
- Better grammatical agreement (gender, case, number)

Flag and discuss when:

- The source string is **ambiguous** and you need product context to choose between meanings.
- The glossary or TM has a translation you disagree with — flag for the project owner, don't override it silently.
- The source is **technically incorrect** (typo or factual error in the English itself).
- A term has **legal/regulatory weight** in the target market and you're unsure whether the chosen translation matches the local statute (e.g. specific labour-law wording).
- A character-limit overflow can't be resolved without losing meaning.

Don't approve translations that:

- Use the casual/informal second-person form anywhere.
 - Translate placeholders, tags, or product names.
 - Drop or invent meaning relative to the source.
 - Use machine-tone phrasing (e.g. literal calques from English).
-

Questions or escalations

Questions regarding the business context and the product itself are welcome and can be sent directly to the project owner through Argos.
